

Engaged Sales — Product guide

Audience: Field staff, supervisors, brand or agency contacts, and administrators — no technical background required.

Purpose: This document explains what Engaged Sales is, how the product is organized, who sees which screens, and how to use it day to day. Share it as onboarding material or a reference for your organization.

Your app address: Your team should give you the exact web link (URL) for your environment. An example deployment may look like `https://engaged-sales-app-web.vercel.app/` — always use the address your administrator provides.

1. What Engaged Sales is

Engaged Sales is a **mobile-first web application** for **sales and field operations**. Teams use it to:

- Run **campaigns in the field** (called **activations** in the product).
- Record **where people were** when they start work (**check-ins**), using **work areas on a map** when your organization requires it.
- Log **sales, outlet visits**, and **stock-related** activity from phones and tablets.
- Let **head office** configure **users, territories, outlets, work areas, reporting**, and **attendance** views.

The same product connects **people on the ground** with **people in the office**. Field users capture activity; operations users maintain the structure that activity belongs to and review performance.

The app can be **installed on your home screen** (like an app) from supported browsers; it is designed to work well on **small screens** as well as laptops.

2. Two workspaces after you sign in

After a successful sign-in, you land in one of two main areas. You do not choose them from a menu in the same way you choose “Field” vs “Ops” — the product **sends you to the right place** based on your **role**.

Workspace	What you call it in the app	Who uses it	What it is for
Field	The header may show “Field” or “Client”	Promoters and Client (read-only) users	Day-to-day execution: activations, check-in, visits, stock, history (depending on role).
Operations	The header shows “Ops”	Supervisors and Admins	Configuration and oversight: users, regions, activations, maps, reporting, attendance, tracking.

Promoters and **supervisors/admins** never share the same default home screen: supervisors and admins are taken to **Operations**; promoters (and clients) are taken to **Field**.

3. Roles — who can do what

Role	Field app	Operations console	In plain language
Promoter	Full Field tools (Home, Activations, Check-in, Outlets, Stock, History)	No access — if you open an Ops link, you are sent back to Field	You execute the work: check in, visit outlets, record sales and stock as your process allows.

Role	Field app	Operations console	In plain language
Client (read-only)	Limited Field — only Home and Activations	No access	You follow assigned campaigns and read-only insights (for example team sales or exports your org enables). You do not enter data on check-in, outlets, stock, or sales.
Supervisor	You are redirected to Ops (not Field)	Full Ops menu for your permissions	You run day-to-day operations: people, territories, campaigns, tracking, reporting.
Admin	Same as supervisor — Ops	Ops, often with extra visibility on the Overview (for example system health)	Full operational control aligned with your deployment.

Critical habit: On the sign-in screen you must pick the **role that matches how your account was set up**. If you pick the wrong role, sign-in will usually **fail** even if your phone number and code are correct.

Location (GPS): Promoters may be asked to **allow location** in the browser so check-ins can be checked against **work areas**. Supervisors, admins, and clients often sign in **without** needing to be inside a geofence — your organization's policy still applies.

4. Getting started (everyone)

4.1 Open the app

Use a **modern browser**: Chrome, Safari, Edge, or Firefox — on a phone, tablet, or computer. Open the **URL** your administrator gave you.

4.2 Sign in

- 1 Open **Sign in** (from the marketing home page, or from a direct link such as `/auth/sign-in` on your server).
- 2 Enter:
 - **Phone number** — as registered by your administrator.
 - **Unique code** — your personal code (often shown like P-... or similar).
 - **Role** — **Promoter**, **Client (read-only)**, **Supervisor**, or **Admin**.
- 1 Submit. If you are a **promoter** and your org uses map-based work areas, **allow location** when the browser asks.
- 2 **Creating an account:** Some organizations allow **self sign-up** from the sign-in page. Others only allow accounts created by a supervisor or admin. Follow what your administrator tells you.

4.3 First screen

- **Supervisor** or **Admin** → **Operations** (`/ops`).
- **Promoter** or **Client** → **Field** (`/dashboard`).

4.4 Sign out

Use **Sign out** in the **sidebar** (wide screens) or **bottom navigation** (phones). That ends the session **on that device**. If you share a device, always sign out when finished.

5. Daily clock-in (promoters only)

Many organizations require promoters to **complete a daily check-in** before the rest of the Field app is available.

What you will notice

- After sign-in, you may be taken straight to **Check-in** until today's clock-in is satisfied.
- Until then, the **main navigation may be hidden** so you complete check-in first.
- Once the system confirms you are done for the gate, you can use **Home, Activations, Outlets, Stock, and History** as normal.

Why it exists: So attendance and presence rules are respected before sales or visit data is recorded.

If you are stuck on check-in, see **Section 10 — Troubleshooting**.

6. Field app — promoters (step by step)

When the app shows “Field” in the chrome, use the **sidebar** (or bottom nav on a phone) to move between sections.

6.1 Home

- Shortcuts to the main tools.
- **Profile** and **sessions** (where shown).
- **Recent sales** — a short list of your latest sale records so you can confirm what went through.

6.2 Activations

- Lists **campaigns (activations)** you are assigned to and can work on.
- Open an activation to see **details, products**, and (where your process allows) **record a sale**.
- Some deployments also expose **downloads** or summaries per activation.

6.3 Check-in

- **Daily clock-in / presence** according to your organization's rules.
- May use **map** or **list** flows depending on configuration.
- **Location** may be required when **work areas (geofences)** are active.

6.4 Outlets (outlet visits)

- **Submit** outlet visit reports (execution notes, visibility, and similar fields your org uses).
- Open **history** of your visits from the outlet area when your build links to it.

6.5 Stock

- Field **stock** workflows (for example summaries or pickups) as defined for your program.

6.6 History

- Your **check-in / location history** (recent field check-ins), not necessarily every type of business event — use Activations or Outlets for campaign- and visit-specific history where applicable.

6.7 Connectivity and “pending” work

On some screens the app shows when you are **offline** or when **data is waiting to upload** (a small outbox or connectivity strip). If you were offline when you submitted something, **wait until you are back online** and give the app a moment to finish syncing before closing the browser.

7. Field app — client (read-only)

When the app shows “**Client**” instead of “Field”, you have a **read-only portal**.

You get

- **Home** — profile and context.
- **Activations** — campaigns **your account is rostered on**. You can open an activation to view **read-only** information such as **team sales** or **exports** (Excel or other formats) if your organization exposes them.

You do not get

- Check-in, outlet visits, stock entry, full history, or **recording sales** as a promoter would.

If you open an old bookmark to a path you are not allowed to use, the app will **steer you back** to allowed areas (typically **Activations**).

8. Operations console — supervisors and admins

When the app shows “**Ops**”, you use the **Operations** layout. The **left sidebar** groups links into sections. Sections can be **collapsed**; the app can **remember** open/closed state on that device.

8.1 Overview

- High-level **snapshot**: users, regions, work areas, outlets, sessions, and related signals.
- **Admins** may also see **platform or API health** indicators where enabled.

8.2 Reporting and performance

- **Reporting** — Run dashboards for a **date range**; filter by **activation** and/or **region**; **export** (for example Excel or PDF) depending on deployment.
- **Reporting settings** — **Scheduled** report delivery (time zone, schedules, recipient emails) if your organization uses it.
- **Stock** — Operational view of stock across the program.
- **Targets** — Targets and performance views as configured.

8.3 Structure and people

- **Users** — Create, edit, deactivate accounts; assign **roles** and **regions** as permitted.
- **Regions** — Territories used to organize people and campaigns.
- **Subwholesales** — Finer structure under regions (for example distributor or sub-territory nodes).

- **Activations** — Create and manage **campaigns**, **rosters**, products, and related setup. (In the sidebar this appears for **supervisors and admins**; it is not the same screen as the promoter's Field "Activations" list, though both relate to campaigns.)

8.4 Field operations

- **Work areas** — Define **geofences** (map zones) where check-in rules apply.
- **Outlets** — **Master outlet list** used across visits and reporting.
- **Attendance** — **Supervisors and admins**: daily roll-up style views for field attendance (depends on org configuration).
- **Live tracking** — **Supervisors and admins**: map-oriented views for operational follow-up.

8.5 Account

- **Organization** — Organization-level information you may view or edit.
- **Account** — Your own **profile**, **sessions**, and sign-out.

Access rule: Promoters (and **clients**) who open /ops are **redirected to Field**. They are not meant to use Operations.

9. Language cheat sheet (glossary)

Term in the app	Plain English
Activation	A campaign or job window: dates, regions, roster, products, sometimes sales rules.
Region	A territory or branch used to group users and campaigns.
Work area / geofence	A map zone where location-based check-in rules apply.
Outlet	A store or location in the master list; field users file visits against outlets.
Check-in	Starting (or confirming) your work day in the field, often with location .
Roster	People assigned to an activation for execution or reporting.
Ops	Operations — the back-office console.
Field	The mobile execution side for promoters (and read-only subset for clients).

10. Troubleshooting

Problem	What to try
Cannot sign in	Confirm phone , unique code , and role with your administrator. Wrong role is a common mistake.
Stuck on check-in (promoter)	Turn on location , move to an allowed work area if your org requires it, wait for GPS to settle, retry. If the problem persists, contact your supervisor with date, time, and approximate location .
"Wrong" or empty activations	Supervisor: check Activations roster and each user's region assignment.

Problem	What to try
Blank or slow screens	Check internet signal; refresh the page; wait a few seconds after going back online for pending uploads .
Session expired	Sign in again — long idle periods can end the session for security.
I am a client and opened an old link	Use Home or Activations from the menu; the app will block paths that are not read-only for you.

11. Practical tips for organizations rolling out Engaged Sales

- 1 **One person, one code** — Do not share personal unique codes; each person should use their own device where possible.
- 2 **Train on vocabulary** — Align internal training decks with **Activation**, **Region**, and **Work area** so helpdesk questions map to the product.
- 3 **Bookmarks** — Bookmarks to /dashboard/... or /ops/... are fine; **role-based redirects** still apply.
- 4 **Add your own addendum** — If your deployment uses custom URLs, disabled features, or extra SOPs, append a short “**Addendum for [company name]**” with your links and who to call.

12. Document maintenance

This guide describes the **Engaged Sales** application structure: Field vs Operations, the four roles above, daily promoter check-in gating where enabled, and the main menu areas. Features may be **tuned per deployment**; your implementation partner should confirm anything marked “where enabled” or “depending on configuration” for your tenant.
